

Vaccination Uptake in Northumberland

Screening and Immunisation Team Cumbria and the North East March 2018

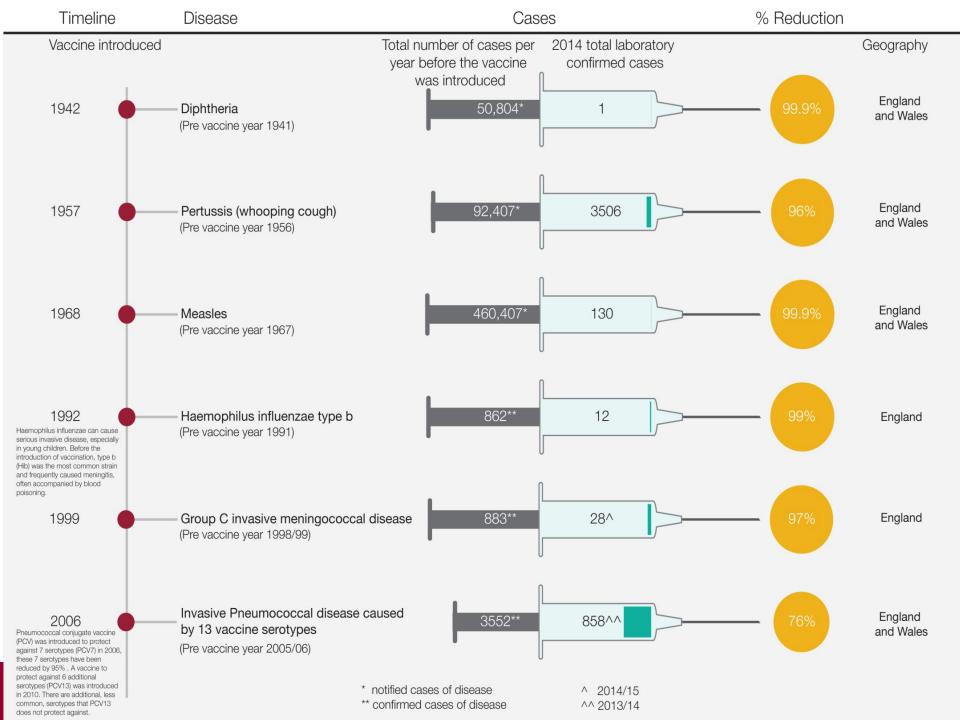

Fergus Neilson, Senior Screening and Immunisations Manager fergus.neilson@nhs.net

Immunisation prevents serious illness and saves lives

After clean water, vaccination is the most effective public health intervention in the world for saving lives and promoting good health

Protects the individual and unvaccinated people around them

Commissioning and delivery – national programmes

Public Health England – national policy advice and leadership

NHS England – commissioner

Public Health England – local public health advice / leadership

Delivery - GPs, school based immunisations services, Trusts, pharmacies

Under 65s in clinical at-risk groups

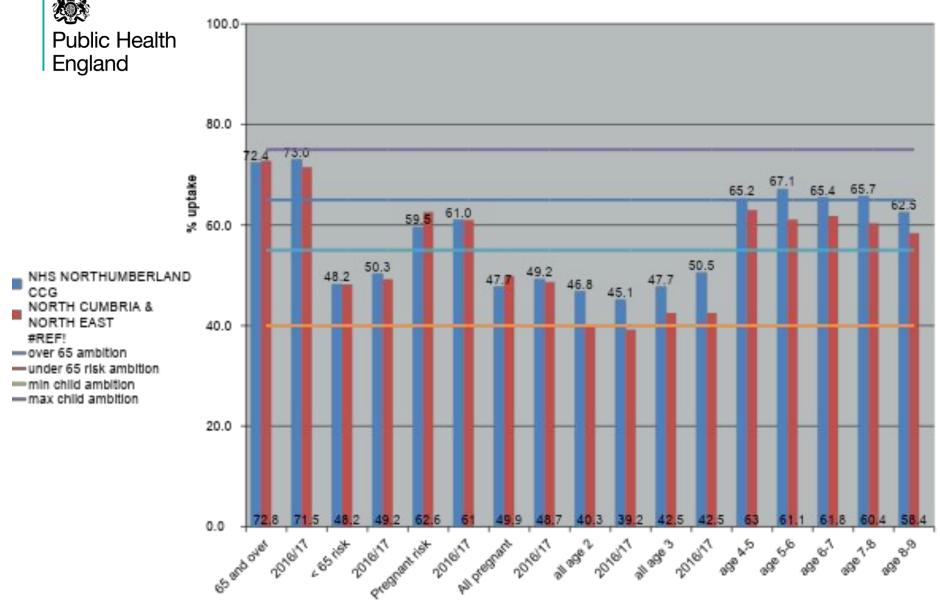

Pregnant women

Children pre-school and selected primary school years

Health & social care workers

Carers

Seasonal influenza vaccine uptake for vaccines given from 1st Sept to 31st Dec 2017

Summary for Northumberland

- Uptake is generally good or very good.
- The recent decline in the childhood imms rates is of concern, but currently thought to be a data flow issue rather than a real decline. We will be working with colleagues in practices, CCG & Northumbria HCT to resolve
- Particular work planned on Flu for Clinical At-risk groups and pregnant women
